BREAKING NEWS

It gets worse – A comparison of official Government reports suggest the Fully Vaccinated are developing Acquired Immunodeficiency Syndrome much faster than anticipated

BY THE EXPOSÉ ON OCTOBER 15, 2021 • (146 COMMENTS)

Listen Now

Latest UK MPHE Vaccine Surveillance Report figures on Covid -19 cases show that doubly vaccinated 40-79 year olds have lost 44% of their immune system capability. Their immune systems are deteriorating at around 5% per week (between 3.8% and 9.1%).

If this continues then 30-59 year olds will have zero Covid/viral defence (and perhaps a form of acquired immunodeficiency syndrome) by Christmas and all double vaccinated people over 30 will have completely lost the part of their immune system that tackles Covid-19 by January next year.

The 5 Public Health England (PHE) tables below from their excellent Vaccine Surveillance Report of all fully genome sequenced delta cases, separated by 5 weeks, clearly show the progressive damage that the vaccines are doing to the immune system's response. PHE have done so much great work and the picture is very clear.

Here is the weekly decline in doubly vaccinated immune system performance compared to unvaxxed people. Vaccine efficacy is measured using Pfizer's vaccine effectiveness formula...

(Unvaxxed case rate – Vaxxed case rate)/the Larger of Unvaxxed or Vaxxed case rate – We are using the ratio of vaxxed to unvaxxed case numbers to determine vaccine efficiency just as Pfizer itself does.

Age group	Week35 Vax Efficacy	Week36 Decline	Week37 Decline	Week38 Decline	Week39 Decline	Week40 Decline	Week40 Vax Efficacy	Average Weekly Decline	Weeks from week40 total immune system failure (100% degradation)

A Vaccine efficacy of **50%** means that doubly vaxxed people are 50% more protected from Covid than unvaxxed people. It means that the delta case rate in the vaxxed is half the delta case rate in the unvaxxed.

A Vaccine efficacy of **-50%** means that unvaxxed people are 50% more protected from Covid than doubly vaxxed people. It means

that the delta case rate in the vaxxed is double the delta case rate in the unvaxxed.

A Vaccine efficacy of **0%** means that doubly vaccinated people are 0% more protected from Covid than unvaxxed people. It means that the delta case rate in the vaxxed equals the delta case rate in the unvaxxed. It means the vaccines have lost all their effectiveness.

Everybody over 30 will have lost 100% of their entire immune capability (certainly for Covid and most likely for viruses and certain cancers – following the evidence from Cole Diagnostics in Idaho and Dr Nathan Thompson) within 16 weeks.

Doubly vaccinated 30-59 year olds will have lost it by Christmas. These people will then have no immune defence to Covid at all. The question then becomes how much of the

reverse) and be specific to Covid, or could be more general and result in a form of vaccine mediated AIDS (Acquired Immune Deficiency Syndrome). The fact that the 3rd Jabs worked in Israel (for a short period of time before the 4th jabs were proposed) means that vaccine antibodies do still have a protective effect immediately after vaccination. So that rules out ADE.

The falling efficacy of the vaccines does not asymptotically approach zero (which would mean that vaccines merely lose effectiveness over time). It goes straight through zero and then goes dangerously negative (which means the vaccines become toxic to the immune system). Then it goes more negative in a linear manner week on week. If this continues then the vaccines will completely destroy the part of your immune system which deals with Covid by the end of January.

The vaccine booster shots have to be the same as the vaccines themselves, because it takes forever to do clinical trials and get approval for something different. So if you take a booster shot, these figures show that you are giving yourself an even faster progressive form of AIDS (after an initial few months of effectiveness). The risk benefit analysis for these vaccines has now become a risk detriment analysis for everyone over 30.

Pfizer originally claimed a 95% efficiency for their vaccine (calculated as in the boost or degradation column above). The figures above indicate that, their figures may well have been correct immediately after vaccination (the younger age groups have had the vaccine for the shortest time). But the figures above also show that the vaccines do NOT merely lose efficiency over time down to zero efficiency. They progressively damage the immune system until a negative efficiency is realised. They presently leave anybody over 30 in a worse position than they were before vaccination. For more see [here](#).
